What is a Tree?

#### Outline

- What is a Tree?
- 2 Encoding XML as Trees

# What is a Tree?

- Graph: a pair (N, E) of nodes N and edges E between nodes of N
- Tree: a directed, acyclic graph T
  - that is connected and
  - no node has more than one incoming edge
- Edges: E(T) are the edges of T
  - an edge  $(p,c) \in E(T)$  is an ordered pair
  - with  $p, c \in N(T)$
- "Special" Nodes: N(T) are the nodes of T
  - parent/child:  $(p,c) \in E(T) \Leftrightarrow p$  is the parent of c, c is the child of p
  - $\bullet$  siblings:  $c_1$  and  $c_2$  are siblings if they have the same parent node
  - root node: node without parent (no incoming edge)
  - leaf node: node without children (no outgoing edge)
  - fanout: fanout f<sub>v</sub> of node v is the number of children of v

#### **Unlabeled Trees**

#### • Unlabeled Tree:

- the focus is on the structure, not on distinguishing nodes
- however, we need to distinguish nodes in order to define edges  $\Rightarrow$  each node v has a unique identifier id(v) within the tree
- Example:  $T = (\{1, 3, 5, 4, 7\}, \{(1, 3), (1, 5), (5, 4), (5, 7)\})$

Augsten (Univ. Salzburg)

What is a Tree?

WS 2018/19

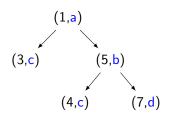

## Node Labeled Trees

#### • Node Labeled Tree:

- a node  $v \in N(T)$  is a pair  $(id(v), \lambda(v))$
- id(v) is unique within the tree
- label  $\lambda(v)$  needs not to be unique

#### Intuition:

- The identifier is the key of the node.
- The label is the data carried by the node.
- Example:  $T = (\{(1, a), (3, c), (5, b), (4, c), (7, d)\},$  $\{(1,3),(1,5),(5,4),(5,7)\}$

Augsten (Univ. Salzburg)

WS 2018/19

What is a Tree?

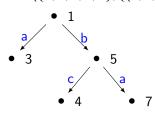

# Edge Labeled Trees

#### • Edge Labeled Tree:

- an edge  $e \in E(T)$  between nodes a and b is a triple  $e = (id(a), id(b), \lambda(e))$
- id(a) and id(b) are node IDs
- $\lambda(e)$  is the edge label (not necessarily unique within the tree)

#### • Example:

$$T = (\{1,3,5,4,7\}, \{(1,3,a), (1,5,b), (5,4,c), (5,7,a)\})$$

What is a Tree?

WS 2018/19 6 / 21

# Notation and Graphical Representation

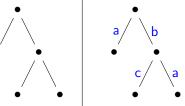

#### Notation:

- node identifiers:  $id(v_i) = i$
- tree identifiers: T<sub>1</sub>, T<sub>2</sub>, ...

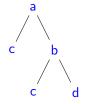

#### Graphical representation

- we omit brackets for (identifier, label)-pairs
- we (sometimes) omit node identifiers at all
- we do not show the direction of edges (edges are always directed from root to leave)

#### unlabeled tree edge labeled tree

node labeled tree

What is a Tree?

#### **Ordered Trees**

- Ordered Trees: siblings are ordered
- contiguous siblings  $s_1 < s_2$  have no sibling x such that  $s_1 < x < s_2$
- c<sub>i</sub> is the i-th child of p if
  - p is the parent of c<sub>i</sub>, and
  - $i = |\{x \in N(T) : (p, x) \in E(T), x \le c_i\}|$
- Example:

# **Unordered Trees**

#### Ordered Trees

• Note: "ordered" does not necessarily mean "sorted alphabetically"

Augsten (Univ. Salzburg)

WS 2018/19 9 / 21

What is a Tree?

# **Edit Operations**

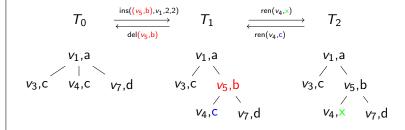

- We assume ordered, labeled trees
- Rename node: ren(v, l')
  - change label I of v to  $I' \neq I$
- Delete node: del(v) (v is not the root node)
  - remove v
  - connect v's children directly to v's parent node (preserving order)
- Insert node: ins(v, p, k, m)
  - remove *m* consecutive children of p, starting with the child at position k, i.e., the children  $c_k, c_{k+1}, \ldots, c_{k+m-1}$
  - insert  $c_k, c_{k+1}, \dots, c_{k+m-1}$  as children of the new node v (preserving order)
  - insert new node v as k-th child of p
- Insert and delete are inverse edit operations (i.e., insert undoes delete and vice versa)

Encoding XML as Trees

#### Representing XML as a Tree

- Many possibilities we will consider
  - single-label tree
  - double-label tree
- Pros/cons depend on application!

Augsten (Univ. Salzburg)

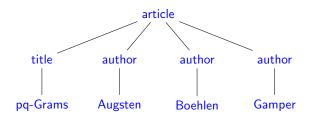

WS 2018/19

13 / 21

Encoding XML as Trees

#### Example: XML as a Single-Label Tree

```
<article title='pq-Grams'>
 <author>Augsten</author>
 <author>Boehlen</author>
 <author>Gamper</author>
</article>
```

Encoding XML as Trees

# XML as a Single-Label Tree

- The XML document is stored as a tree with:
  - XML element: node labeled with element tag name
  - XML attribute: node labeled with attribute name
  - Text contained in elements/attributes: node labeled with the text-value
- Element nodes contain:
  - nodes of their sub-elements
  - nodes of their attributes
  - nodes with their text values
- Attribute nodes contain:
  - single node with their text value
- Text nodes are always leaves
- Order:
  - sub-element and text nodes are ordered
  - attributes are not ordered (approach: store them before all sub-elements, sort according to attribute name)

Augsten (Univ. Salzburg)

Similarity Search

WS 2018/19 14 / 21

Encoding XML as Trees

#### XML as a Double-Label Tree

- Node labels are pairs
- The XML document is stored as a tree with:
  - XML element: node labeled with (tag-name,text-value)
  - XML attribute: node labeled with (attribute-name,text-value)
- Element nodes contain:
  - nodes of their sub-elements and attributes
- Attribute nodes are always leaves
- Element nodes without attributes or sub-elements are leaves
- Order:
  - sub-element nodes are ordered
  - attributes are not ordered (approach: see previous slide)
- Limitation: Can represent
  - either elements with sub-elements and/or attributes
  - or elements with a text value

Encoding XML as Trees

## Parsing XML

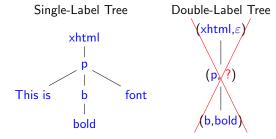

We discuss two popular parsers for XML:

- DOM Document Object Model
- SAX Simple API for XML

Example: Single- vs. Double-Label Tree

Encoding XML as Trees

<xhtml> This is <b>bold</b> font. <xhtml>

WS 2018/19 18 / 21

Encoding XML as Trees

# DOM - Document Object Model

- W3C<sup>1</sup> standard for accessing and manipulating XML documents
- Tree-based: represents an XML document as a tree (single-label tree with additional node info, e.g. node type)
- Elements, attributes, and text values are nodes
- DOM parsers load XML into main memory
  - random access by traversing tree :-)
  - large XML documents do not fit into main memory :-(

Encoding XML as Trees

# SAX – Simple API for XML

- "de facto" standard for parsing XML<sup>2</sup>
- Event-based: reports parsing events (e.g., start and end of elements)
  - no random access :-(
  - you see only one element/attribute at a time
  - you can parse (arbitrarily) large XML documents :-)
- Java API available for both, DOM and SAX
- For importing XML into a database: use SAX!
